

Hi Suhanisa,

I hope all is well! Per our Product SLA, we do not provide support for custom scripts written by customers and used in Adaptavist add-ons, so I cannot provide you a script (<https://www.adaptavist.com/products/atlassian-apps/product-sla>). However, looking at your code, I quickly noticed a few things that may easily fix your problem.

Your third line has a typo which can cause an error.

```
def issueManager = ComponentAccessor.issueManager
```

Try this instead:

```
def issueManager = ComponentAccessor.getIssueManager()
```

The documentation for `ComponentAccessor` can be found here:

<https://docs.atlassian.com/software/jira/docs/api/9.7.0/com/atlassian/jira/component/ComponentAccessor.html>

Next, be sure to change the text `"Something"` to `"Updated"` since that is what you want the `textField` to say.

```
issue.setCustomFieldValue(textField, "Updated")
```

Setting the value of a Select List will follow similar steps to setting the value of a Text Field, but doing so will require some more steps. You can take a look at this solution to a similar problem: <https://community.atlassian.com/t5/Jira-questions/Is-it-possible-to-set-a-select-list-field-value-when-an-issue-is/qaq-p/1099151>

Hope this helps! If you have any more questions, feel free to reach out again.

Thanks,
Gagan
